

IDS case study: Drive through control

Automatic photo portal for the documentation of intralogistics processes

Due to digitalisation in Industry 4.0, internal logistics is subject to constant change. Internal traceability is increasingly playing a key role in this. Systems for automation can contribute to the optimisation of goods control and at the same time facilitate and accelerate the work of operators - saving time and costs. An example of the successful implementation of a system for internal traceability in intralogistics can be found at Schnellecke Logistics, Germany.

At the Dingolfing site, a scalable quality assurance solution from Pose Automation GmbH, Kleve, provides comprehensive photo documentation for incoming and outgoing goods inspection. The P.Portal used in a logistics hall takes over the analysis and documentation of the condition of the goods and uses high-intensity USB3 Vision industrial cameras from IDS.
