

# Good news for IDS customers

## New USB 3 cameras for short delivery times

Due to the worldwide semiconductor shortage and the resulting long delivery times for USB 3 cameras, IDS decided early on to develop new hardware solutions. The result is an alternative USB 3 hardware generation with available advanced semiconductor technology for our proven cameras of the uEye CP, ACP, SE and LE families.

To be precise: For our uEye+ cameras of the CP, ACP, SE and LE families, we are offering you alternative hardware revisions step by step and in addition to our established, but unfortunately limited available USB 3 models. For your projects we recommend to use the new hardware revisions. Electronic components are in stock, prototypes for design-ins for many models are available. Series production of the new USB 3 camera revisions is being established and will then be continuously expanded.

All of the upcoming USB 3 cameras are supported by our modern, versatile and standards-compliant software development kit **IDS peak**. **IDS peak** includes programming interfaces and software tools necessary for operation and programming of the cameras. Easy-to-understand "It's so easy!" convenience features ensure an intuitive programming experience, quick and easy commissioning and versatile use of your industrial cameras.

For short delivery times, we also recommend our USB 3 cameras of the [uEye XCP](#) and [uEye XLE](#) families, which are also newly developed and barely affected by semiconductor shortages. Our sales team is available to answer your questions regarding the introduction of the new hardware revisions and the cost-optimized models of the uEye XCP and XLE series. For our customers working with GigE interface: we are already in the development of a corresponding available camera platform. We will announce the market launch in a similar way.
