

# IDS NXT cockpit becomes the central tool for setup and configuration

## Software update for IDS NXT focuses on simple workflows and user-friendliness

There is now a new software update available for the IDS NXT platform. This means more comfort for customers in dealing with the intelligent cameras and the associated tools. The IDS NXT cockpit now offers additional options for setup and configuration.

In the future, the IDS NXT cockpit will inform customers immediately when new firmware updates are available for their IDS NXT cameras. This helps you to install and use the latest OS version as soon as it is released.

From now on, the camera IP address can also be configured directly via the IDS NXT cockpit - even if the camera is located in a different subnet.

On the camera side, IDS NXT OS 1.2 adds a security measure: instead of the default password, a new camera password needs to be assigned before a camera can be accessed with the IDS NXT cockpit. Only after this it is possible to make configuration adjustments or display a live image.

The new IDS NXT cockpit and IDS NXT OS 1.2 are available on our website for free download. For further information, you will also find the latest release notes and manuals for the products of the IDS NXT platform in the download area.
